

Return To Service Australian Terminals

SLP, and its participating terminal partners in Australia, are implementing a new method for dealing with tankers loading for the first time, after Returning To Service (RTS) from maintenance, repairs, servicing, cleaning or inspection.

SLP conducted a trial in South Australia, that has proved to be very successful. The new RTS process is easy to use and has been effective at reducing confusion and miscommunication in the current return to service process.

For many participants it this change will simply be an awareness of the new process used by Inspection locations, Drivers and Fuel Terminal Operators.

The aim of our new RTS process is to reduce complexity, to make the process move available to those that have the responsibility to see RTS process completed. Create a basic and simple method of tanker hand over and eliminate spills related to a poor Return To Service practices.

Throughout 2023 SLP will be traveling the country providing information sessions and information handouts at your location.

Please contact me at SLP and I would be very happy to provide more information about the new RTS process for your business, I am happy to provide information sessions or RTS information packs?
